

How to replace HR11-0061-A

Step 1

Unplug the electrical connection. Make sure that the oven is not powered, also disconnect the gas supply

This is for your safety

Take off the side panels

You will be able to do so after moving the oven off the wall

To remove them you have to turn the latches by turning them a quarter of the way counterclockwise or by removing the screws depending on the oven's panel type

Step 2

You will first have to locate the convection motor.

Start off by disconnecting the white molex connector.

Then take off the 8 screws around the motor (11MM wrench needed)

Afterwards the whole assembly will come out by simply pulling, you may replace it with the new parts and perform the steps backwards to put the oven together.
