

How to replace the power supply (HR11-0101-A)

Step 1

Unplug the electrical connection. Make sure that the oven is not powered, also disconnect the gas supply

This is for your safety

Take off the side panels

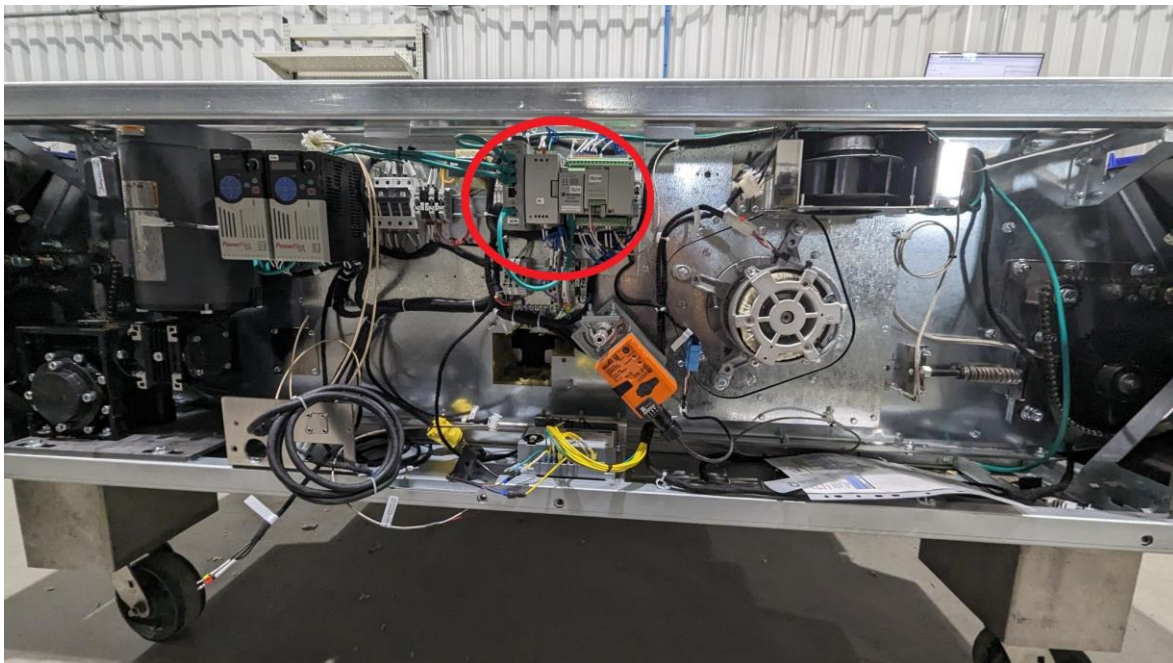

You will be able to do so after moving the oven off the wall

To remove them you have to turn the latches by turning them a quarter of the way counterclockwise or by removing the screws depending on the oven's panel type

Step 2

You will have to locate the Power supply

It is located in the middle of the unit it is right next to the PLC

Step 3

Now that you've found the power supply in the oven you can start unplugging the wires connected to it

Marking the wires before removing them is ideal but if you didn't do it, here is where they should be plugged:

L= 3L1L

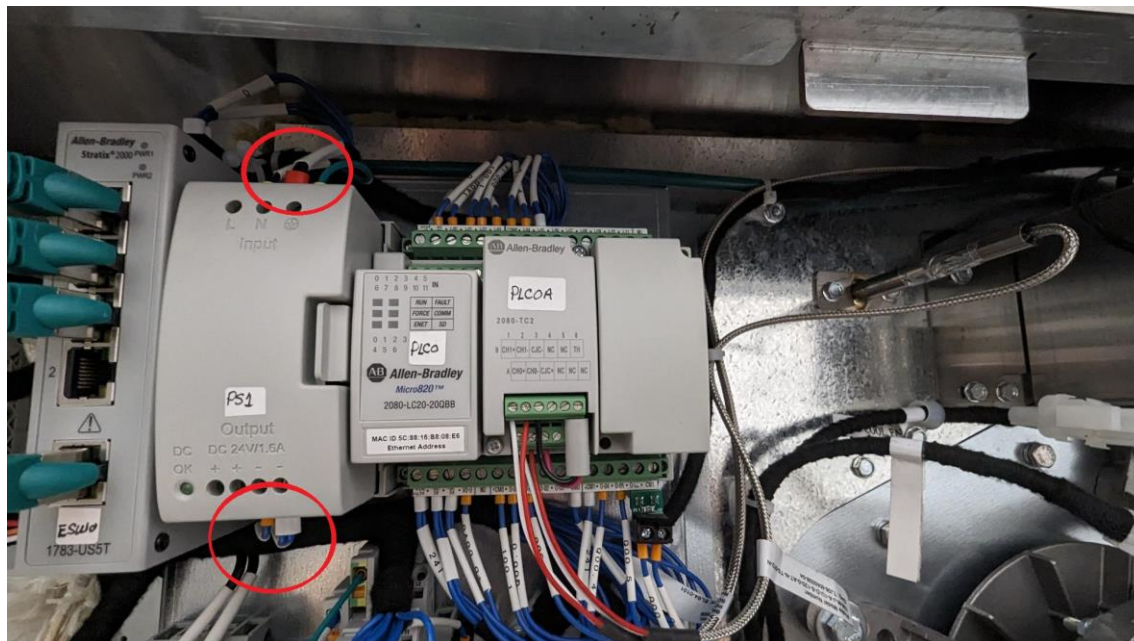

N= 3L2L

+= 240

+=N/A

-= 0

-= N/A

Step 4

To replace the part you will have to remove the PLC & power supply assembly from the rail

To do so you will have to unclip them (indicated on the pictures)

Now that the 3 clips holding them in place are removed you can simply pull the bottom of the PLC and power supply towards you and lift the assembly up

There is a latch holding the Power supply with the PLC you can simply push it and slide the power supply off

Now that its all done you can do the steps backwards with the new power supply
